Computer Science IA Feedback

1. **UI needs to look more student-made — major concern**
    - The current interface looks too professional/AI-generated.
    - It should look like something an IB student could realistically design and code independently.
    - Simplify the UI where necessary so it feels producible by a student rather than a professional developer.
2. **Add more advanced/complex search queries**
    - Expand the search functionality with more useful filters and query options.
    - Example: show all entries where the difference exceeds ₹2,000.
    - Add around **4–5 more query/search options**, preferably through additional buttons or filters.
3. **Code evidence for Criterion D**
    - Include code snippets showing:
        - How the database is connected to the program.
        - How database queries are created and executed.
        - How the program retrieves and processes the queried data.
4. **Expand the History section**
    - The History page should maintain records of previous ledgers and reconciliation reports.
    - Add filters so users can search previous reconciliations using multiple conditions.
    - Example: find reconciliations completed between **20–30 August**, with an **amount difference of ₹200** and a **date difference of 6 days**.
    - The user should be able to retrieve all matching transactions/reconciliation records.
5. **Add a separate Ledger Management tab**
    - Create a separate section where users can manually add ledger entries directly within the application.
    - Users should also be able to edit/update existing ledger entries.
    - This allows the application to maintain the ledger without requiring Excel.
    - Keep the existing option to upload PDF statements/ledgers as well.
    - This should be an **additional feature**, not a replacement for PDF uploading.
6. **Support multiple bank statements**
    - Investigate whether the system can accept **2–3 bank statements/accounts simultaneously** and reconcile them against one ledger.
    - Example: a client may have accounts with multiple banks, and transactions from all of them should be matched against the same ledger.

7. **Testing/demo requirements**

    - The final demonstration should contain around **20–30 entries** so that the system has enough data to properly demonstrate its functionality.
    - When recording the final IA video, **Miss will advise which specific features/processes should be demonstrated to maximise marks**.
